## Calculation of 2014 Crude Average CI Value

Posting: Section 95486(b)(2)(A)3 of the Low Carbon Fuel Standard (LCFS) Regulation states that each year the Executive Officer will post the Annual Crude Average carbon intensity calculation at the ARB-LCFS website for public comment. Written comments shall be accepted for 15 calendar days following the date on which the analysis was posted. Only comments related to potential factual or methodological errors in the posted Annual Crude Average carbon intensity value may be considered. The Executive Officer shall evaluate the comments received and, if the Executive Officer deems it necessary, may request in writing additional information or clarification from the commenters. Commenters shall have 10 days to respond to these requests. The Executive Officer shall post the final Annual Crude Average carbon intensity value at the ARB-LCFS website within 15 days of completion of the comment period, if no comments are received. If comments are received, the Executive Officer shall post the final Annual Crude Average carbon intensity value within 15 days of receiving any additional information or clarification requested from the commenters by the Executive Officer.<sup>2</sup>

Calculation of 2014 Crude Average CI: As described in subsections 95486(b)(2)(A)1 and 3, the 2014 Crude Average CI value is a volume weighted average of carbon intensities for crudes supplied to California during 2012, 2013, and 2014. The tables below show a breakdown of the sources of crude oil supplied to California refineries during 2012 to 2014 as well as the carbon intensity values assigned to these crude sources. All crude oil produced in and offshore of California during the time period of 2012 to 2014 was assumed to be refined in California.<sup>3</sup> The volume contributions for California produced crudes are based on oil production data obtained from the California Department of Conservation.<sup>4</sup> The volume contributions for California federal offshore crudes are based on oil production data obtained from the Bureau of Safety and Environmental Enforcement. 5 The volume contributions of imported crudes are based on oil supply data submitted by refineries via a survey for 2012 volumes and annual compliance reporting for 2013 and 2014 volumes. Seventy-three crude names that do not appear in Table 8 (the Crude Lookup Table in section 95486(b)(1)) were supplied to California refineries during 2012, 2013, and 2014. These crudes contributed only 8.6 percent of the total volume of crude supplied to California refineries and are

1

<sup>&</sup>lt;sup>1</sup> The LCFS regulation is found at California Code of Regulations (CCR), title 17, sections 95480-95490. Subsequent section references are to CCR title 17.

<sup>&</sup>lt;sup>2</sup> Comments and ARB responses are contained in the appendix to this document.

<sup>&</sup>lt;sup>3</sup> The total volume of California state and federal offshore crude supplied to California refineries as reported to ARB was 656 million barrels, which closely matches the total volume reported by oil producers to California Department of Conservation and Bureau of Safety and Environmental Enforcement of 653 million barrels.

<sup>&</sup>lt;sup>4</sup> California Department of Conservation, Online Production and Injection Query, <a href="http://opi.consrv.ca.gov/opi/opi.dll">http://opi.consrv.ca.gov/opi/opi.dll</a>, (accessed May 29, 2014, and April 17, 2015).

<sup>&</sup>lt;sup>5</sup> Bureau of Safety and Environmental Enforcement website http://www.data.bsee.gov/homepg/data\_center/production/PacificFreeProd.asp, (accessed May 2013, May 2014, and April 2015).

assigned the 2010 Baseline Crude Average CI value of 11.39 gCO<sub>2</sub>e/MJ.<sup>6</sup> The 2014 Crude Average carbon intensity, 11.30 gCO<sub>2</sub>e/MJ, is calculated by weighting the carbon intensity value for each crude by the volume supplied to California refineries during 2012, 2013, and 2014.

**Table 1: 2012 Refinery Crude Supply** 

Country/State	Crude Name	CI (g/MJ)	2012 Volume (bbl)
	2012 Volume Weighted Average CI	11.35	594,494,779
Algeria	Saharan	11.39	1,411,725
Angola	Dalia	7.86	2,803,487
	Gimboa	11.39	177,590

Canada	Albian Muskeg River Heavy	11.39	375,060
	Albian Heavy Synthetic	21.02	4,407,187
	Cold Lake	18.74	4,540,591
	Koch Alberta	7.61	53,570
	Lloydminster	11.39	2,773
	Mixed Sweet	7.75	53,570
	Peace River Sour	11.39	360,000
	Shell Synthetic Light	11.39	475,489

<sup>&</sup>lt;sup>6</sup> In conjunction with the re-adoption of the LCFS and update to OPGEE v1.1, staff has calculated carbon intensity values for all crudes supplied to California refineries during 2010, 2011, 2012, 2013, and 2014 that are not in the current Crude Lookup Table (Table 8, section 95486(b)(1)). ARB intends to make use of these new carbon intensity values in calculating Annual Crude Average CI values for 2015 and later years.

## **Appendix: Responses to Comments**

Comment: See comment at

http://www.arb.ca.gov/lispub/comm2/bccomdisp.php?listname=lcfs-crude-oil-

ws&comment\_num=8&virt\_num=2

Response: These comments appear to be based on confusion caused by the new format used to display calculations in the 2014 Crude Average CI document. This year, three separate tables are provided in place of a single table in the previous year's calculations. The 2014 calculation has a separate table for year 2012 (Table 1 starting on page 2), year 2013 (Table 2 starting on page 8), and year 2014 (Table 3 starting on page 14). In the first row of each table, the average CI for that year's crude supply and the total volume of crude supplied that year are shown. The 2014 Crude Average CI value of 11.30 g/MJ is a volume weighted average of all crudes supplied over the three year period. To determine if incremental deficits are to be assessed we compare this "three-year rolling average crude CI" to the 2010 Baseline Average Crude CI.

Comment: See comment at

http://www.arb.ca.gov/lispub/comm2/bccomdisp.php?listname=lcfs-crude-oil-ws&comment\_num=9&virt\_num=3

Response: The commenter shows that there can be significant variance between the CI value assigned to a field and the CI of the crude of an individual producer located within the field; the comment advocates use of facility-specific data in determining CI values.

In calculating the Annual Crude Average CI, the LCFS regulation requires the use of CI values approved through a formal regulatory process. The field CI values used to calculate the 2012, 2013, and 2014 Annual Crude Average CIs were approved as part of the 2011/2012 LCFS regulatory amendment process. Moreover, when calculating a volume-weighted average CI value such as the 2014 Crude Average CI, there will be little difference between using average field CIs and field volumes versus using individual operator CIs and operator volumes, as all crude produced in California was refined in California.
